The catalytic activity of charcoal in the formation of hydrogen bromide from hydrogen and bromine. H. Bruns and O. Zgrubias. *J. Phys. Chem.* (U. S. S. R.) 11, 800-4 (1938).—A max. catalytic activity of sugar charcoal with respect to the reaction  $H_2 + Br_2 = 2HBr$  was observed with the charcoal activated to 10%, whereas the max. activity with respect to adsorption ability was observed with 35% activated charcoal. The heat of activation of the above reaction was independent of the degree of activation of the charcoal and equal to 30,000 cal. (av.). A decrease in the catalytic activity and adsorption ability of charcoal with higher degree of activation is explained by decrease in the surface of charcoal owing to burning out of small crystals. Seven references.

The change of isotherm shape on continued activation of charcoal. 15. Brun and  
 16. Zarlina. *Kolloid-Z.* 66, 270 (1933); cf. C. A. 23, 3014. Treat and sugar  
 charcoals were activated at 800° in  $\text{CO}_2$  showing increasing percentage loss in weight.  
 Adsorption at 10° was det. in a Mellin sorption balance. At low vapor  
 pressures of  $\text{C}_2\text{H}_6$  or ether, max. adsorption occurred on charcoals with 35 to 65% loss  
 in weight. At vapor pressures near sat. there is a continuous increase in adsorption  
 with increased loss in weight. 16. shows a similar behavior, though the form of the  
 isotherm is different and appreciable adsorption occurs only at 60% humidity. Ad-  
 sorption of  $\text{H}_2\text{O}$ , butyric acid, and  $\text{PhOH}$  from aq. solns. gives a similar picture. At  
 first activation is mainly by burning of org. residue and stripping of the graphite frame-  
 work, bringing about an increased adsorption. After a definite loss the entire inner  
 surface is free and further loss in weight increases the size of the pores and diminishes  
 the low-pressure adsorption. The high pressure adsorption is increased as a result of  
 greater pore vol. Also in *J. Phys. Chem.* (U. S. S. R.) 5, 270-4 (1933). Arthur Fleischer

TITLE: Vibrational spectra of organoarsenic compounds. Communication 4. Infrared spectra and structure of cyclic arsenic-containing derivatives of pentaerythritol

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 9, 1966, 1543-1546

TOPIC TAGS: organic arsenic compound, IR absorption spectrum, IR spectrum, pentaerythritol

SUB CODE: 07

ABSTRACT: In a continuation of earlier investigations, the infrared absorption spectra of seven cyclic derivatives of arsenous, alkylarsinous, and arylarsinous acids with pentaerythritol were obtained and interpreted. Spectra are cited for:

- 1)  $C(CH_2OH)_4$ ; 2)  $P(OCH_2)_3CCH_2OH$ ; 3)  $As(OCH_2)_3CCH_2OH$ ; 4)  $As(OCH_2)_3CCH_2OAs$  ;
- 5)  $As(OCH_2)_3CCH_2OAs(C_2H_5)_2$ ; 6)  $As(OCH_2)_3CCH_2OAsPh_2$ ; 7)  $C_2H_5As(OCH_2)_2C(CH_2O)_2AsC_2H_5$ ;

TITLE: Investigation of the Microbiological Oxidation of the  
Pyrite of Coal (Issledovaniye mikrobiologicheskogo  
okisleniya pirita uglya)

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh  
nauk, Metallurgiya i toplivo, 1959, Nr 1, pp 117-119 (USSR)

ABSTRACT: This is a preliminary communication on work carried out  
jointly by the Laboratoriya Obogashcheniya IGI AN SSSR  
(Enrichment Laboratory of the IGI AS USSR) and the  
Institut Mikrobiologii AN SSSR (Institute of Microbiology  
of the AS USSR) on the oxidation of coal pyrites by  
microbiological methods. The work was started in 1957  
as part of the general study by the former organization  
of methods of oxidizing coal pyrites for desulphurization.  
A culture of Thiobacillus ferro-oxidans was prepared and  
added to coal samples. In one of each pair of samples  
the bacteria were killed. Analysis for sulphur after 10,  
20 and 30 days showed that in these no desulphurization  
occurred in contrast to the samples with live bacteria  
(table). The fineness of the coal and the age of the

Card 1/2

TITLE: Allyl and Methallyl Ethers of the Acetals and Ketals of Xylite and Xylitane (Allilovyye i metallilovyye efiry atsetaley i ketaley ksilita i ksilitana)

PERIODICAL: Zhurnal obshchey khimii, 1958, Vol 28, Nr 12, pp 3206-3210 (USSR)

ABSTRACT: Based on a few syntheses of the allyl and methallyl ethers of multivalent alcohols described in references 1, 2 and 3 the authors synthesized the same ethers of the acetals and ketals of xylite and xylitane by the action of allyl bromide and methallyl chloride on them in a solvent in the presence of pulverized caustic soda. The initial products synthesized according to references 4, 5, 6, namely 2,4-3,5-dimethylene xylite, 2,3-4,5-diacetone xylite, and 2,3-4,5-dibenzylidene xylite contain a free primary hydroxyl group, so that the position of the allyl and methallyl group in the molecule of the reaction products in the first carbon atom is beyond any doubt (Compounds III, IV, V, VI, XII, XIII, XIV, XV). Di-cyclohexylidene xylite was obtained according to a synthesis of cyclohexylidene xylitane (Ref 7) carried out by the authors

Card 1/2

Allyl and Methallyl Ethers of the Acetals and Ketals  
of Xylite and Xylitane

SOV/79-28-12-8/41

already earlier. To solve the problem whether a free primary hydroxyl group is in the dicyclohexylidene xylite its triphenyl methyl ether was synthesized, whereby the position of the allyl and methallyl group at the primary carbon atom in this ether was proved (VI and XV). Based on earlier experiments (Ref 7) the allyl group in the acetals and ketals of xylitane can be only at the second or third carbon atom (VIII, IX, X, XI). There are 3 tables and 8 references, 1 of which is Soviet.

"Production of the Slurry Pump Rotors of Alloy IChKh28N2 by Investment Casting"

Kiev, Tekhnologiya i Organizatsiya Proizvodstva, No 2, 66, pp 28-31

TOPIC TAGS: metal casting, chromium containing alloy

ABSTRACT: The "Ukr NIiuglemashobogashcheniye" institute developed and tested a technical process for making rotors of alloy IChKh28N2 by investment casting to reduce as much as possible the amount of mechanical working, to increase the fineness and accuracy of the geometric molds of rotor surfaces. This method permits accurate casting of any difficult-to-work cast alloy.

The chemical composition of alloy IChKh28N2 is as follows: C 2.7-2.9%, Si 0.8-1.1%, Mn 1.5-1.8%, Cr 28-30%, Ni 1.5-2.8%, S 0.04% and P 0.09%; Brinell hardness in the cast state was 474-502.

The microstructure of the casting consisted of fine and coarse carbides (Cr, Fe)<sub>7</sub>C<sub>3</sub>.

By hardening at 1100° and subsequent tempering at 550-600°C the hardness

of the castings can be increased to 540-600 Brinell units. Thereby, the wear resistance of the alloy is increased.

The results of comparative tests of experimental specimen rotors made of the alloy IChKh28N2 and of series produced rotors made of cast iron SCh15-32 is as follows:

Alloy	Average weight kg	Average actual operating time before total	Average weight after tests, kg	Weight loss, kg	Wear for 100 hours, kg	Coefficient of relative wear resis- tance of the rotors
IChKh28N2	21.8	4288	15.1	6.7	0.16	-
Cast iron						
SCh 15-32	22.5	330	16.3	6.2	1.86	11.7
